

Eisen-Fischer plans significant time and cost savings each year with Perfon live connection to SAP

"We considered several systems before we decided for Perfon PIM. The combination of shadow database and PIM system in one, as well as the ability to configure Perfon completely by ourselves, convinced us. But price was also a criterion - Perfon is inexpensive compared to other solutions"

Manfred Scheunemann,
Master of Science in
Information Technology,
Eisen-Fischer GmbH

Challenge

In addition to the 80,000 articles that are created as standard items in Eisen-Fischer's ERP system SAP, the company can obtain multiples of articles from its approximately 4,000 suppliers. For an efficient and error-free quote and order creation, a simple and fast access to the widest possible range of data of this product offering is imperative.

The acquisition of the data into the SAP system must - in order to avoid transmission errors - be automated and - for better acceptance among employees - easy to handle. The previous search in analog sources such as flip catalogs and the manual data acquisition must belong to the past.

Solution & Benefits

With the new shadow database from Perfon, Eisen-Fischer's employees can now quickly find all the products (stock items and suppliers' articles) and add them directly to the order lines in the SAP system, without having to create all products in SAP.
